

Graphic card sharing/conflicting with sound card (Windows XP only)

Keywords / Key Phrases: graphic card conflicts

In the event the graphics card is sharing the same IRQ address with the sound card, this will most likely cause conflict with each other as both devices are major hardwares in the computer. To resolve this, it is recommended to move the sound card to another empty slot.

This will change the IRQ to another number so that it will not conflict with the graphics card. It is not required to uninstall the sound card but if you are prompted, please install the latest driver available from our downloads at <http://support.creative.com/> .
