

Message "Please insert disk1 that contains the file layout.bin" while installing an application

Keywords / Key Phrases: installshield, layout.bin, Please insert disk1 that contains the file layout.bin"while installing an application error during installation

Summary:

- ✓ The following procedures were adapted from former Installshield's support site.

The message "Please insert disk1 that contains the file layout.bin" displayed below, while installing an application (for example, Creative Alchemy), may also appear for different files (e.g. Please insert disk 1 that contains the file data2.cab).

To resolve this message, you can add the **-a** and **-deleter** command-line options to the installation file through the command line. The **-a** and **-deleter** command-line options prevent the installation from cleaning up too early.

To do so, follow these steps:

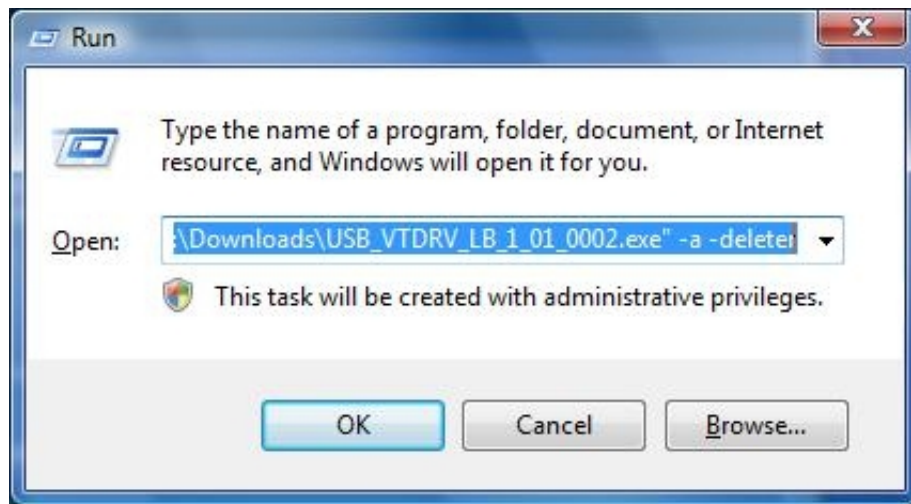

1. Open Windows Explorer.
2. Browse to the location (folder) where you have saved the executable file package (e.g. the file that you have downloaded previously).
3. Copy the location (the complete file path) and file name, for example:

C:\Downloads\USB_VTDRV_LB_101_002.exe

4. Click **Start**, **Run** and paste or type the location and file name surrounded by double quotes into the **Open** field, for example:

"C:\Downloads\USB_VTDRV_LB_101_002.exe"

5. Add the **-a** and **-deleter** command-line options, making sure to have spaces before each '-':

6. Click OK. The installation should extract and run without errors

Note: It is always recommended to install the latest software updates from the [Creative support site](#).
