

Digital recording

Keywords / Key Phrases: receiver, amplifier, digital recording

In the event that the audio was not being recorded from the receiver, instead you are able to record from the loop back from Digital I/O module, this only indicates that the sound card is capable of recording from the Digital I/O Module. Therefore, please focus on the audio signal produced from the receiver and identify if the audio is in the form of digital PCM (stereo) or digital bit-stream (Dolby Digital/DTS).

Our software and sound card is only capable of recording from digital PCM (stereo) source. It is unable to record signals from a digital bit-stream in encoded format such as Dolby Digital or DTS from DVD or DVD-Audio.
