

SPDIF Connection from Motherboard to Sound Card

Keywords / Key Phrases: SPDIF connection, connect

I would like to inform you that Creative sound card does not come with the 3 pin connector for SPDIF as the SPDIF output wire available on your motherboard is mainly used for connecting to the SPDIF jacks located on your computer casing. Moreover the SPDIF output on the motherboard is from the onboard audio integrated in the motherboard. As such, the connection will not work as the Creative sound card and the integrated onboard audio are two different audio devices.
