

Latency from internal sound card

Keywords / Key Phrases: latency, internal soundcard

Internal sound card has a much lower latency as compared to USB sound cards. However this latency cannot be completely eliminated as a fraction of the time is needed for audio processing on the sound card. To ensure that the latency is reduced to the minimum, it is recommended to optimize your system to ensure that there are no conflicting devices.

Kindly refer to the article below to optimize the sound card performance:

[SID 46913: Optimizing your System for Better Sound Performance](#)

If you are still experiencing latency, please contact our Customer Support with the delay time from the time you speak into the microphone till the audio is being heard from the speakers or headphone.
